Appcelerator Dashboard Release Notes

Dashboard 6.4.0 - 10 July 2019

Dashboard 6.4.0 is a minor release, which includes several improvements and bug fixes.

Improvements

- With recent improvements to AMPLIFY Platform's single sign-on facilities, the **Keep me signed in for a week** option has been removed from the **Sign In** page. Browser sessions will expire after 30 minutes of inactivity. Tooling sessions (logging in via CLI or Studio) will still remain active for 7 days.
- Removed strict normalization of analytics events platform information. Now platforms other than iOS, Android, and "(not set)" will be displayed in chart and table series grouped by Platform.
- Added all usage metrics to the organization **Usage** view. This view now displays monthly usage of Application Integration transactions and lists usage by environment type (for example, "Axway Managed" vs VPC or "Customer Managed").
- Added a table to the organization overview which shows the product, plan, start, and end dates of each organization subscription.
- Improved date range calculations to always include the most recent period. Previously, a selection of **Last 24 Hours** would exclude the current hour. Analytics view chart series will now include partial results for the current hour.
- Improved usability of the **Custom Query**. The **New Query** and **Clear** controls are more consistent and obvious. The label for previewing query results was changed to **Preview**. Once a query is saved, the user is transitioned back to their list of saved queries.
- Removed distinct values for session identifiers in **Custom Query** filters.
- Added Mobile Backend Services (MBS) application creator and date information to the MBS application **Overview** tab.
- Added a primary action on the Choreography tile to link to ACE's new UI once an organization is subscribed and provisioned.
- Corrected the link to the **Content Collaboration** tile's **How It Works** content.
- Added the display of the application identifiers on AMPLIFY Runtime Services application **Overview** view.
- Improved build verification error messages to make it clear why the build failed and how users can correct the build process.
- Improved the display and consistency of the AMPLIFY Runtime Services and Mobile Backend Services access logs.
- Migrated AMPLIFY Crash Analytics views to display `crash.breadcrumb` events.

Fixed issues

- Resolved an issue uploading symbol files for applications.
- Resolved a potential login issue when accessing AMPLIFY Platform in private browsing/Incognito.
- Resolved an issue where Mobile Backend Services applications may have been created without an application name.
- Fixed breadcrumb sorting and limit in the AMPLIFY Crash Analytics detail view.
- Fixed Custom Query display for mix/max values to show infinity if there are no results.
- Fixed an issue where the **Back** button on Mobile Backend Services data views may link to the landing page.
