

Resources Actions

- Requirements
- Description
- Invocation
- Get all accessible project names

Requirements

The examples in this page use the **Prototype** library, which is included by default inside a portal. However, the same concepts may be applied using other implementations.

Description

These set of actions can retrieve various resources information from the Studio. At the moment it's pretty limited to listing projects, but more will be added in time.

Invocation

This command is executed immediately in a synchronous way.

Get all accessible project names

The following *dispatch* call will get a names array of all the accessible (open and existing) project names:

```
var allProjects = dispatch($H({
  controller: 'portal.resources',
  action: "getProjects"
})).toJSON().evalJSON();
```

The returned value is an array of strings (names).
