

Dashboard 8.1.0 Release Note

Dashboard 8.1.0 - 23 September 2020

Dashboard 8.1.0 is a minor release which includes new features, improvements, and bug fixes.

New features

- Introduced a new *Activity* view accessible from the notifications (bell) icon in the common header or the left-hand menu on the user's *Account* view. The *Activity* view shows additions, deletions, and changes performed by or on the user and changes to the organization and its apps and services for the user's current organization.
- Introduced a new org *Activity* view accessible from the left-hand menu on the *Organization* view. The *Activity* view shows changes to the organization, its subscriptions, and its apps and services.
- Introduced a new app *Activity* view accessible from the left-hand menu on any app view. The *Activity* view shows events related to the apps.
- Added the ability to download *Analytics* view charts as an image.
- Added modules used by *Titanium* applications to the *App Overview*.
- Added four widgets to the *Metric Overview* available for organizations which have **AMPLIFY Central** provisioned showing occurrences of Central Asset, Central Environment, Catalog Item, and Catalog Subscription events.
- Selecting a time range on *Analytics* view charts will now "zoom in" on that date range.

Improvements

- Revised the *Latest Activity* and *Notifications* accessible from the notifications icon in the common header. Their entries are now combined into a single list of *Recent Activity*. Clicking on an entry in this list takes the user to the user *Activity* view to see more details about the event.
- Improved resolution (i.e., number of data points shown) on *Analytics* view charts.
- Improved labels on the x-axis of charts on *Analytics* views.
- Changed the *Subscriptions* section of the *Organization* overview to show only active subscriptions on initial load. Terminated, inactive, and pending subscriptions can be viewed by selecting that status from the dropdown above the table.
- Added a link to the *Titanium SDK Prerequisites* documentation on the *Get Started with App Builder* guide. This documentation shows supported dependency versions and their download locations.
- All applications deployed using **AMPLIFY Runtime Services** now show a type value of "Runtime Service" on the all apps table.

Fixed issues

- Fixed an issue where users may not be able to edit their *Account* information in Safari.
- Fixed an issue where Firefox for Android was shown as an unsupported browser (it's totally supported!)
- Fixed an issue where the organization *Usage* view may not have shown the correct entitlement quotas when viewing usage for prior months.
- Fixed an issue where **AMPLIFY Runtime Services** application access logs may not have been properly format response times greater than one second.
- Fixed an issue where application names may not have been included in exported chart or table data.
